
How linearly recoverable is the FINAL representation from each depth?
$R^2 = 1 - \|\hat{H}_{20} - H_{20}\|_F^2 / \|H_{20} - \bar{H}_{20}\|_F^2$ (global, variance-weighted; test split)
ridge alignment (stars = 5% forecasting-tunnel entrance)
test representation R^2 vs $h_{20,15}$
representation point $h_{\ell,15}$
